Steve Crossman CEO The ExP Group

We provide these ExPress notes free of charge to individual students as part of our CSR initiatives. The notes are designed to help students assimilate and understand the most important areas for the exam as quickly as possible.

A word of warning though in that they have not been designed to cover these notes for either Preview ing in the c if / of th al revis ain studies or as part Importantly though, we want you to be successful in your exams so good luck with your studies and please do let us know how you get on.

About The **ExP** Group

should be used. To use technology to open up education, and in particular financial education,

financial expertise, organisations to improve their performance through enhanced human to benefit as a result.

We're on target and since our birth we have had the privilege of working with and learning from inspirational individuals and organisations east, South Africa in the south and the Cayman Islands in the west.

Thank you for being part of our story.

01 Specialist Cost & Management Accounting Techniques

Key Knowledge – Activity Based Costing (ABC)

ABC is a memory there exists to go to contract costs according to the activities costs ing those costs. The activities giving risk to mecoly and contract to source (.) / an integration is (cost drivers), it becomes possible to charge costs to the agents under a king those activities.

Free complete book at

A factory clinic with total annual costs of \$500,000 serves two Workshops A and B. Workshop A bas 200 mprovees and Workshop B bas 300 employees A conventional way or apportioning the cost wear be on the basis or employees.

> Workshop A: (200/500) x 500,000 = 200,000 Workshop B: (300/500) x 500,000 = <u>300,000</u> 500,000

An ABC approach might look at the number of visits to the clinic by the employees of A and B.

Workshop A: 150 visits p.a. Workshop B: 70 visits p.a.

In this case, the apportionment could be:

Workshop A: (150/220) x 500,000 = 340,909 Workshop B: (70/220) x 500,000 = <u>159,091</u> 500,000

The different levels of usage may reflect different degrees of occupational hazard present in the two workshops.

ABC advantages: provides a more precise way to determine costs per unit of output, especially since not all overhead costs are driven by production volumes.

Budgetary planning, pricing decisions and managing performance are all facilitated by ABC.

ABC disadvantages: it can be complex and costly to implement. It is not a "plug-in-and-go" system! It is therefore imperative that management carefully weigh the costs against the (expected) benefits from ABC before deciding to implement it.

Key Knowledge – Target Costing

This is a market-oriented approach to costing that starts by identifying the likely price that a product can fetch in the market, deducts the profit that the product is expected to earn, and arrives at the maximum (target) cost of manufacturing the product.

Such a method usually requires successive iterations in order to close a "cost gap", i.e. where the costs are above the triggread Grein Product ordering, iteration requires a cost gap", i.e. where the costs are examined in order to a uneverse cost or costs of a Green Costs of Costs

Free complete book at

development/design, launch and maintenance fall unevenly across time periods. This method takes a

Key Knowledge – Throughput Accounting

This method is consistent with a JIT environment and focuses on the bottlenecks in a production process; by eliminating these bottlenecks, it raises the amount of output that can flow through the process (assuming there is demand for the output – the idea is not to produce for inventory!).

The throughput accounting approach itself considers all costs (including direct labour) as fixed and treats only direct materials as being variable in the short term. Throughput means revenue less material costs.

The throughput accounting ratio is calculated as: $\frac{Return \ per \ factory \ hour}{Cost \ per \ factory \ hour}$

Where:

Return per factory hour = $\frac{Throughput per unit}{Time on bottleneck process per unit}$

Cost per factory hour = $\frac{Total factory costs}{Total bottleneck resource time available}$

Decision Making Techniques

The Big Picture

One of management's responsibilities involves making decisions affecting the firm in the short-run based on relevant <u>cost</u>s.

What is release? Review pages

A relevant cost is a cash cost which is uniquely incurred (or avoided) as a consequence of taking a <u>decision</u>; cash, because it is the main determinant of value (unlike a counting profit); and unique in the

- In the component protecting of the first o

not relevant to the decision.

If, however, there is a difference in the two insurance costs, then one can speak of the difference between the two choices as being "incremental"; this difference (referred to in some places as the "differential") is relevant to the decision under consideration.

Future

Relevant costs refer to the future, i.e. they can be influenced prospectively by choice. It follows that:

Sunk costs are not relevant: They have already taken place and cannot be reversed.

Committed costs, if they cannot be avoided, are likewise not relevant, even if the timing of their occurrence is in the future. Their "unavoidability" has already been established in the past (making them effectively the equivalent of sunk costs).

In keeping with the above logic, relevant costs therefore involve cash, are incremental and relate to the future.

Written permission needs to be obtained in advance if you are planning on using them on a training course you're delivering. Reproduction by any means for any other purpose is prohibited. These materials are for educational purposes only and so are necessarily simplified and summarised. Always obtain expert advice on any specific issue. Refer to our full terms and conditions of use. No liability for damage arising from use of these notes will be accepted by the ExP Group. Relevant costs need to be identified with care, as they may include opportunity costs.

Example

A company considers building a storage facility on the site of a parking lot. If the parking lot had been generating parking fees that will now be lost, then this foregone revenue is an opportunity cost.

Key Knowledge – Break Even Analysis

Cost-Volume-Profit (CVP) Analysis

The breakeven formula

Total Costs = Fixed Costs + Unit Variable Cost x Number of Units

Total Revenue = Sales Price x Number of Units

If TC Potal For eview pages FC = Fixed Costs, Free Complete book at TR = Total Refer to the page t

C = SP - V = Unit Contribution and

CM%= C/SP = Contribution Margin,

Then the *break-even point* (the output level at which TR=TC) is:

- In units sold: X = FC/C
- In dollar sales: TR = FC/CM%

Disclaimer: © 2020 The ExP Group. Individuals may reproduce this material if it is for their own private study use only. Written permission needs to be obtained in advance if you are planning on using them on a training course you're delivering. Reproduction by any means for any other purpose is prohibited. - Safety Margin = Budgeted Sales Break-even point (units/dollars)
- C is an important indicator, as it shows the contribution of each unit sold towards covering fixed costs. Therefore, in the short run, the firm may prefer to produce/sell below break-even in order to recover some of its fixed costs.

Relevant costs, incremental analysis and linear programming

- Relevant costs are costs expected to vary with the action taken
 - Past (sunk) costs are irrelevant
 - Fixed costs are irrelevant if there is idle capacity
 - Variable (marginal) costs are relevant
 - Opportunity costs (foregone benefits) are relevant
- Incremental analysis uses relevant costs in order to quantify the short-term effects of business decisions taken.

Applying incremental analysis in business decision-making

- Accept or reject a special order
 - Accept if selling price exceeds variable production cost and there is spare capacity
- Make (in baracine) on bur (tut Quinin) Out pure lease office. Eactive of full and the Best of Carital burdenting
- Capital budgeting

• Invest if marginal cost of investing is below marginal cost of not investing (marginal

Divest if (marginal revenue generated + cost of resulting idle capacity + severance

Divest if (marginal revenue generated + cost of resulting idle capacity + severance payments + restoration costs) fall below marginal cost of production + salvage value of

Key Knowledge – Limited Factor Decisions

Determining optimal mix of products where there is one limiting factor

- 1. Calculate contribution per unit generated by each product.
- 2. Identify the number of units (kg/litres) of the limited factor used by each product.
- 3. (1) \div (2) \Rightarrow contribution per unit of limited factor generated by each product.
- 4. Produce product with highest contribution per unit of limited factor first, up to maximum demand, then produce product with second highest, etc. until all the limited factor is used up.

Determining optimal mix of products where there is more than one limiting factor

Use linear programming:

1. Define variables (Let X = output of product 1, Y = output of product 2)

2. Define objective function: (This expresses total contribution). Y = mX + nY (where m = contribution per unit for X and n = contribution per unit for Y).

3. Define constraints: Shows maximum use of each limited resource – (e.g. $3X + 4Y \le 4,000$ would be a constraint where each unit of X uses 3 units of the resource and each unit of Y used 4 units of the resource, and the resource is limited to 4,000 units per period).

4. Draw diagrams of all the constraints and plot the objective function for one value of contribution. Point of maximum contribution is where a line parallel to the contribution line is within the feasible region bounded by all the constraints, e.g. here the point of maximum contribution will be one of the corner points, A, B, C or D.

Key Knowledge – The Price Elasticity of Demand

This measures the sensitivity of (customer) demand to a change in prices. There is usually an inverse relationship: when price goes up, demand goes down (and vice versa).

PED = <u>% change in demand</u> % change in price

Example

A cinema increases its ticket prices from \$4 to \$6; as a result, the number of cinema goers drops from 2,000 to 1,500.

The PED = (500/2000) = $25\frac{\%}{50\%}$ = 0.5 (Note: Ignore + or – signs; take the absolute value) (2/4) 50%
